DemoDecomp: an R Package for General Demographic Decomposition Methods

author redacted
August 10, 2018

Abstract

Background

Most demographic indices are functions of parameters, such as age-structured rates. There are many case-specific methods to decompose differences in indices to differences in parameters, but only a few general methods exist.

Objective

We aim to demonstrate the use of two general decomposition methods available in the R packageDemoDecomp.

Methods

Two methods are demonstrated: pseudo-continuous decomposition proposed by Horiuchi et. al. (2008) and stepwise replacement decomposition (stepwise_replacement()).

R Markdown

This is an R Markdown document. Markdown is a simple formatting syntax for authoring HTML, PDF, and MS Word documents. For more details on using R Markdown see http://rmarkdown.rstudio.com.

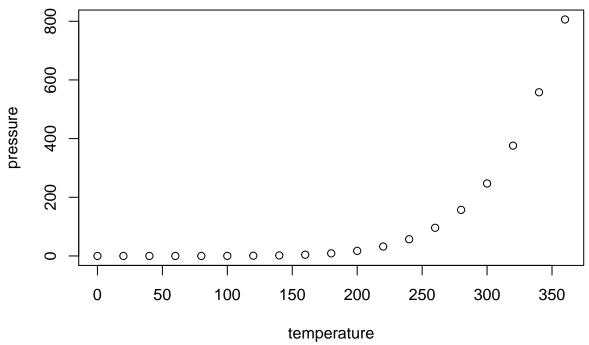

When you click the **Knit** button a document will be generated that includes both content as well as the output of any embedded R code chunks within the document. You can embed an R code chunk like this:

summary(cars)

```
##
       speed
                        dist
   Min. : 4.0
                   Min.
                          :
                             2.00
   1st Qu.:12.0
                   1st Qu.: 26.00
   Median:15.0
                   Median : 36.00
   Mean
          :15.4
                          : 42.98
   3rd Qu.:19.0
                   3rd Qu.: 56.00
##
   Max.
           :25.0
                   Max.
                          :120.00
```

Including Plots

You can also embed plots, for example:

Note that the echo = FALSE parameter was added to the code chunk to prevent printing of the R code that generated the plot.
